

Operating Systems

CMPT 424 • Fall 2017

-iProject Four (final) - 200 points

Goals	To improve on the functionality from iProject Three (all of which is required) by adding a local file system and swapped virtual memory so you can execute more processes than you have partitions for in memory. Also, to make something of which you are proud, that you can show people, and brag about, and talk about in job interviews for years to come.
Functional Requirements	<p>Add shell commands for the following disk operations:</p> <ul style="list-style-type: none"><input type="checkbox"/> <code>create <filename></code> — Create the file <i>filename</i> and display a message denoting success or failure. [10 points]<input type="checkbox"/> <code>read <filename></code> — Read and display the contents of <i>filename</i> or display an error if something went wrong. [10 points]<input type="checkbox"/> <code>write <filename> "data"</code> — Write the data inside the quotes to <i>filename</i> and display a message denoting success or failure. [10 points]<input type="checkbox"/> <code>delete <filename></code> — Remove <i>filename</i> from storage and display a message denoting success or failure. [10 points]<input type="checkbox"/> <code>format</code> — Initialize all blocks in all sectors in all tracks and display a message denoting success or failure. [10 points]<input type="checkbox"/> Add a shell command, <code>ls</code>, to list the files currently stored on the disk. [5 points]<input type="checkbox"/> Add a shell command to allow the user to select a CPU scheduling algorithm — <code>setschedule [rr, fcfs, priority]</code> [3 points]<input type="checkbox"/> Add a shell command, <code>getschedule</code>, to return the currently selected cpu scheduling algorithm. [2 points]<input type="checkbox"/> [challenge] See challenges on next page [+ points]
Implementation Requirements	<ul style="list-style-type: none"><input type="checkbox"/> Implement a file system in HTML5 session storage as discussed in class. [20 points]<input type="checkbox"/> Include a file system viewer in your OS interface. [5 points] <p>Develop a File System Device Driver (fsDD) for all of the functional requirements noted above.</p> <ul style="list-style-type: none"><input type="checkbox"/> Load the fsDD in a similar manner as the keyboard device driver. [5 points]<input type="checkbox"/> Develop your fsDD to insulate and encapsulate the implementation of the kernel-level I/O operations (noted above) from the byte-level details of your individual blocks on the local storage. [20 points] <p>Add new scheduling algorithms to your CPU scheduler. Default to RR.</p> <ul style="list-style-type: none"><input type="checkbox"/> first-come, first-served (FCFS) [10 points]<input type="checkbox"/> non-preemptive priority (You will need an optional load parameter here.) [10 points] <p>Implement swapped virtual memory with enough physical memory for three concurrent user processes.</p> <ul style="list-style-type: none"><input type="checkbox"/> Allow the OS to execute four or more concurrent user process by writing roll-out and roll-in routines to ... [70 points]<ul style="list-style-type: none">• Take a ready process and store it to the disk via your fsDD.• Load a swapped-out process from disk and put it in the ready queue.• Your ready queue should denote which processes are where.<input type="checkbox"/> Your code must separate structure from presentation, be professionally formatted, use and demonstrate best practices, and make me proud to be your teacher. [-∞ if not]<input type="checkbox"/> You must commit to Git early and often. I am not kidding. [-∞ if not]
Submitting	Update GitHub with your current code.
